

# Application of Data Science

---

CMP020L014 S/A

## What to expect

- This module will review different applications where data science has had a tremendous impact in the last decade.
- Data Science has dominated almost all the industries of the world today. Various sectors like marketing, agriculture, journalism, security, healthcare, etc., use data science.
- The aim of this module is to develop students' awareness of the application areas of data science techniques.
- Learning Outcomes
  - LO1: Demonstrate a comprehensive understanding of current developments in data science.
  - LO2: Systematically and critically analyse and evaluate **diverse sources of data** to solve a problem.
  - LO3: Propose and develop a data science solution for a **complex dataset**.

# Topics and Assessment

Topics	Week(s)
Introduction to explainable artificial intelligence	1
Mathematical morphology and noise filters	2
Image data padding and thresholding	2
Video analytics	2
Visual feature extraction: Histogram of oriented gradients	1
Image data enhancement and augmentation	1
Time-dependent data	2
Sampling theorem	1
Advanced parametric and non-parametric statistical tests	If time allows
Structural equation modelling	

Assessment	Weight	Submission method	Due date
<b>Presentation (Coursework Milestone 1)</b>	50%	In-class	<b>Week-9 or later</b>
<b>Final Coursework</b>	50%	Moodle Submission	<b>Assessment week</b>

**Make a group of 3**

## Plagiarism during coursework submission

- Plagiarism while submitting the coursework is seen as presenting someone else's work or ideas as your own, with or without their consent, by incorporating it into your work without full acknowledgment.
  - All published and unpublished material, whether in manuscript, printed or electronic form, is covered under this definition.
- Plagiarism during the assessment is unethical and can have serious consequences.
  - The University regards plagiarism in examinations/assessments as a serious matter.
  - Cases will be investigated, and penalties may range from deduction of marks to expulsion from the University, depending on the seriousness of the occurrence.
- You have come to university to learn to know and speak your own mind, not merely to reproduce the opinions of others.
- While submitting, if any coursework shows more than 20% similarity will likely be rejected.

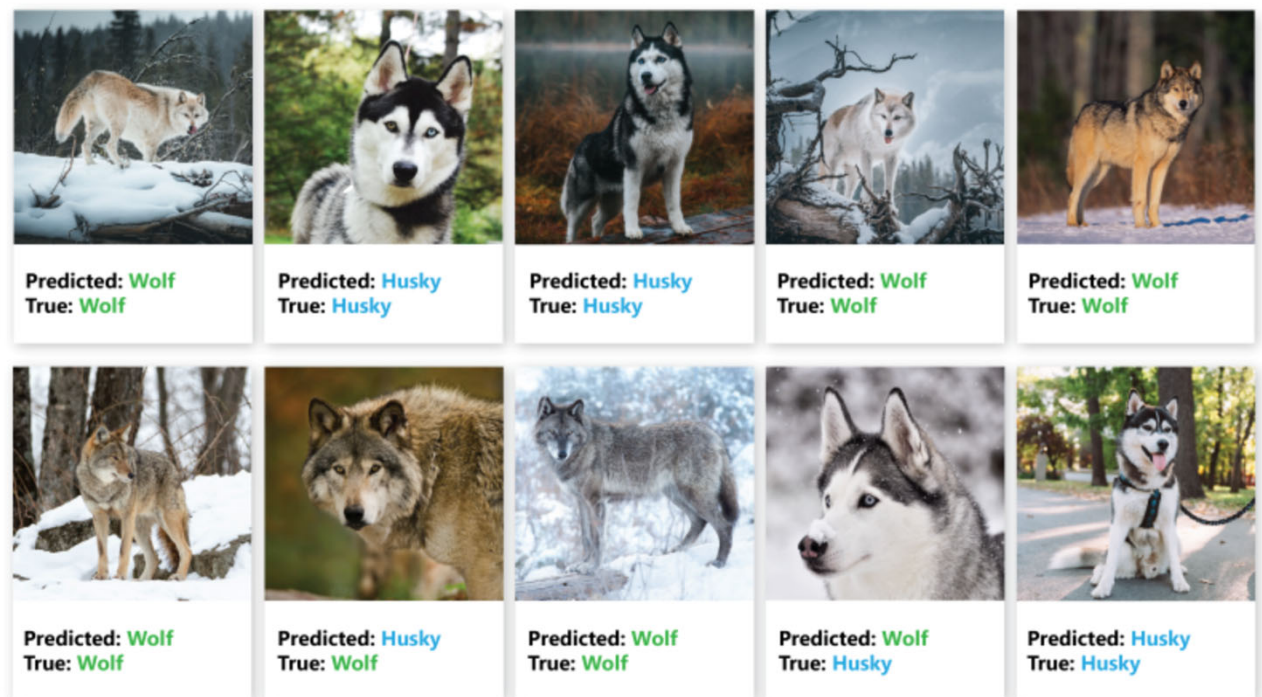

# Explainable Artificial Intelligence

---

# Explainable Artificial Intelligence (XAI)

- XAI is a field that focuses on making AI systems and their decisions understandable to humans.
- In simpler terms, it's about adding transparency to AI, so we can understand why it makes certain choices and the reasoning behind its actions.

## Explain the Prediction

What is bias in AI?

## Why XAI is Important?

- Trust and acceptance: When we understand how AI works, we're more likely to trust its decisions and accept its recommendations.
- Bias detection and mitigation: AI models can be susceptible to biases, leading to unfair or discriminatory outcomes. XAI techniques can help us identify these biases and mitigate them.
- Debugging and improvement: Understanding how AI models work makes it easier to debug them when they make mistakes. We can also use this knowledge to improve their accuracy and performance.

## Approaches to XAI

- Depending on the complexity of the AI model and the desired level of explanation. Some common techniques include:
  - Feature importance: This identifies which features of the input data have the most influence on the AI's decision.
  - Counterfactual explanations: These explain how the AI's decision would have changed if the input data had been different.

Do we need to glow the whole box?

# Data & Processing

---

# Types of Data

- **Structured data:** This type of data is organized in a fixed format, like rows and columns in a spreadsheet or database.
- **Unstructured data:** This type of data has no predefined format and can be messy and complex. Examples include text documents, images, videos, audio, etc.

DATA TYPE	FIELD	FIELD TYPE	LIST EXAMPLES now							
OBJECT	Object Type	text	painting	sculpture	installation	sketch	computer model	magazine	work in progress	
	Title	text	The Man	The Tree						
	Medium	text	oil on canvas	sketchbook	maple	cardboard				
	Size Width	numerical	30	36	1705					
	Size Height	numerical	22	43	654					
	Size Depth	numerical	29	47	89					
	Size Time	date	defult: today							
	Date	text	when							
	Inscriptions	text	where							
	Signature	text	text box							
	Commentary	text	text box							
	Article Description	text	text box							
	Location	text	studio	gallery	museum	public art	private collection			
	Location Name	text	studio							
	Relationships	text	is part of	Series						
	PHOTO OF OBJECT	text	front	rear	left	right	top	bottom		
	View	text	studio	exhibition	gallery					
	Location Name	text								
	Location	Geographic Address								
	Series	text	abstract heads	cuppinges	groundworks					
	Top	text								
	Commentary	text								
	EXHIBITION	text								
	Location Name	text								
	Location	Geographic Address								
	Creator	text								
	Media	text								
	Date	date								

Which one is more relevant to real-world?

## Good Data vs Big Data

- The notion of "good data" being more important than "big data".
  - It's more about prioritising quality over quantity.
  - Big data boasts impressive volume, while good data emphasises meaningful information and accurate insights.
- Quality over Quantity:
  - Garbage in, garbage out
  - Focus on relevance: Not all data is created equally.
- Ethical Considerations:
  - Bias and privacy: Big data often raises concerns about privacy and algorithmic bias.
  - Transparency and trust: Trust in data-driven decisions requires transparency in data collection and analysis. Good data fosters trust by adhering to ethical principles and responsible practices.

# Advantages of Data Pre-processing

- Improved explainability and interpretability:
  - Cleaning and filtering data: Removing noise, outliers, and inconsistencies in the data.
  - Feature scaling and normalisation: Ensuring features are on the same scale can prevent dominant features from overshadowing the contributions of others.
  - Feature engineering: Creating new features or combining existing ones to better capture relevant information can make explanations more concise and understandable.

## Advantages of Data Pre-processing

- Efficient model training and explanation generation:
  - Reduced complexity: Pre-processed data is often smaller and easier to work with, leading to faster training times and more efficient explanation generation, especially for complex models.
  - Resource-saving: By ensuring data quality and consistency, pre-processing can optimize resource utilization during model training and explanation, reducing computational costs.

Image of Abraham Lincoln as a matrix of pixel values

# Image

- An image is a visual representation of something.
- It can be 2D/3D, which can be fed into the visual system to convey information.
- In the context of data processing, an image is a distributed amplitude of color(s).
- The smallest element of image is called pixel.
  - Pixel is a point on the image that takes on a specific shade or color. In data science, 2D/3D images usually represented in the following way:
    - Grayscale - A pixel is an integer with a value between 0 to 255 (0 is completely black and 255 is completely white).
    - RGB - A pixel is made up of 3 integers between 0 to 255 (the integers represent the intensity of red, green, and blue).
